@system

Non-Life Insurer Management Software

Philosophy

The @System is a user-friendly computer tool for the management of non-life insurers.

It was constructed based on the customer and distribution channels of the company.

Based on the Customer and Distribution Channels

Project

The programming and marketing of the @System is carried out by EXTREMOS - Software. The analysis and support of the project has been developed with ACTUARIAL - Consultadoria. Both companies are specialists in insurance and pensions.

Companies specialised in Insurance and Pensions

Extremos

The core business of Extremos - Software is the production and marketing of software for insurers and pension fund management companies.

Specialists in Insurance and Pension Technology

Actuarial

Actuarial - Consultadoria is a consulting firm with extensive experience in actuarial consulting and particularly in valuation of pension plans, provisions, tariffs, classification of risks and data mining where it produces regular studies on insurance relative to automobiles, occupational accidents, health, general civil liability, personal accidents, credit and bonds, reinsurance and pension funds.

MODULAR APPLICATION

The @System has been developed in a modular form, enabling the acquisition of the modules which are of most interest to an insurer. From the central module of the business, to management statistics and control, reinsurance and accountancy, the application enables the integration of various management tools developed specifically for the purpose.

A set of tools to resolve your problem

MANAGEMENT OF CONTRACTS

The system permits the management of any insurance contract. Insurance Policy Holders, Insured Persons, Objects and Life Assured are administered in a simple manner and covering all facets of the business.

Comprehensive management

MANAGEMENT OF CLAIMS

The application is prepared to administer the most widespread non-life insurance claims; whether they are indemnities, compensations, assistance or refunds. Everything is done in a parameterised form which enables defining policies of provisioning by average cost, on a case-by-case basis.

Any type of claim

MANAGEMENT OF COLLECTION

The @System permits administration of the collections of any type of contract, regardless of the existence or not of distribution channels and automatic forms of collection.

Accounts of each customer or service provider are provided automatically.

Easy management of collection

STATISTICS

The @System has a module which enables extraction of the management control system and technical statistics that you require. All the information is calculated in accordance with the technical, financial and actuarial precepts of the non-life insurance business. However, the user is released from this duty, since the system deals with the complexities and permits the extraction of results in a very user-friendly manner.

All the information that you need

ACCOUNTANCY

The @System includes a general and analytic accountancy application specifically designed for the insurance business, so that the technical movements can have an immediate repercussion on the financial area. This application also allows for the simultaneous existence of alternative plans to enable meeting international commitments.

The system manages all the financial statements, including the accounting notes.

General and Analytic Accountancy and Alternative Plans

TABLES FOR THE INSPECTION AUTHORITIES

The @System also enables the automatic management of the tables required for the inspection authorities, since it has an appropriate engine for this purpose.

Tables for the Inspection Authorities

REINSURANCE

The application has a reinsurance module which enables parameterisation of the reinsurance plans in an integrated form with policies, claims and accountancy. There is automatic control of insurance risks and immediate production of accounts with the reinsurers.

CO-INSURANCE

The @System also has a co-insurance module that is integrated with policies and claims, enabling the management of contracts, whether leader or non-leader. The accounts with the co-insurers and all the contracts and claims movements are produced in an integrated manner with the accounting.

ACTUARIAL STUDIES

The @System also enables integrating the business management application with the applications for analysis of technical results and valuation of provisions for claims, automatically generating the necessary data-warehouses.

Technical and Actuarial Integration

OFFICE

The application is integrated with Microsoft Office tools, permitting the import and export of Excel and Word files.

Easier Work

DEVELOPMENT ENGINES

The application is highly parameterised, enabling the creation of various events without the need for programming, including products, sub-products, mini-products, coverage and blocks of coverage.

The level of sophistication of these engines enables anticipating many of the changes in the market and legislation, ruling out the need for time-consuming and expensive additional programming.

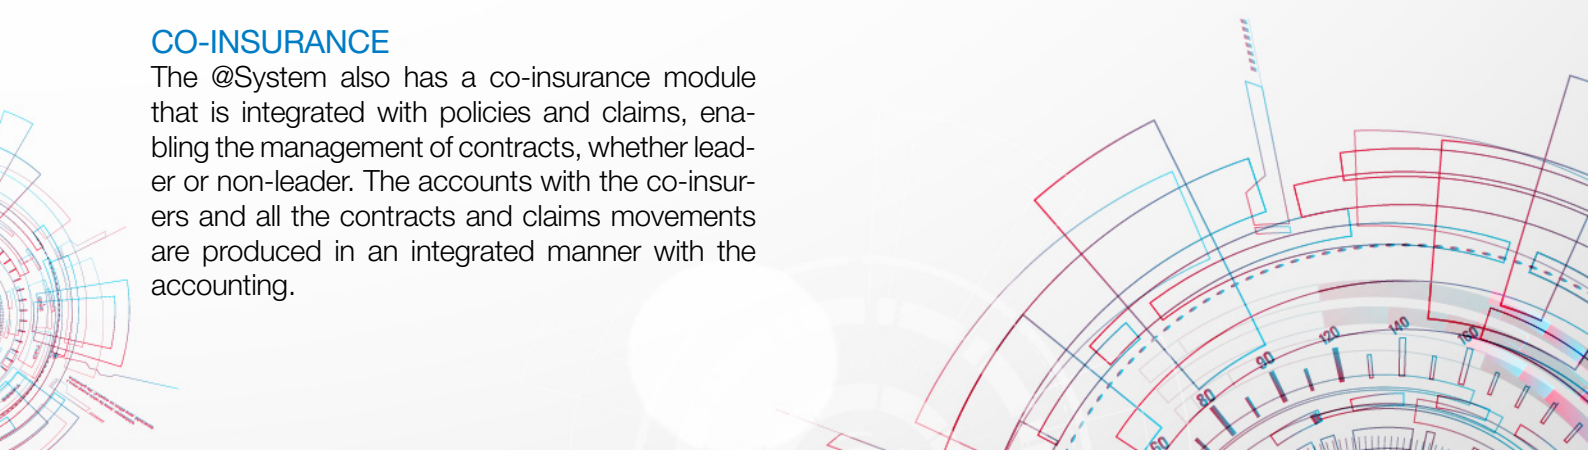

On the other hand, its modular nature enables focusing the acquisition only on the modules that meet your specific business needs.

MULTI-CURRENCY AND MULTILINGUAL

This is a multi-currency application which enables working with more than one currency at the same time.

It is also prepared with more than one language.

High Parameterisation and Modular Nature

SUPPORT AND ASSISTANCE

Having the @System also means the possibility of the ongoing training of your staff, as well as assistance at any place.

So that you do not feel alone
